Guide méthodologique

## DÉMARCHE SURE

Étude d'enjeux de sécurité routière pour la  
hiérarchisation des itinéraires

# Improving Safety of Existing Road Networks

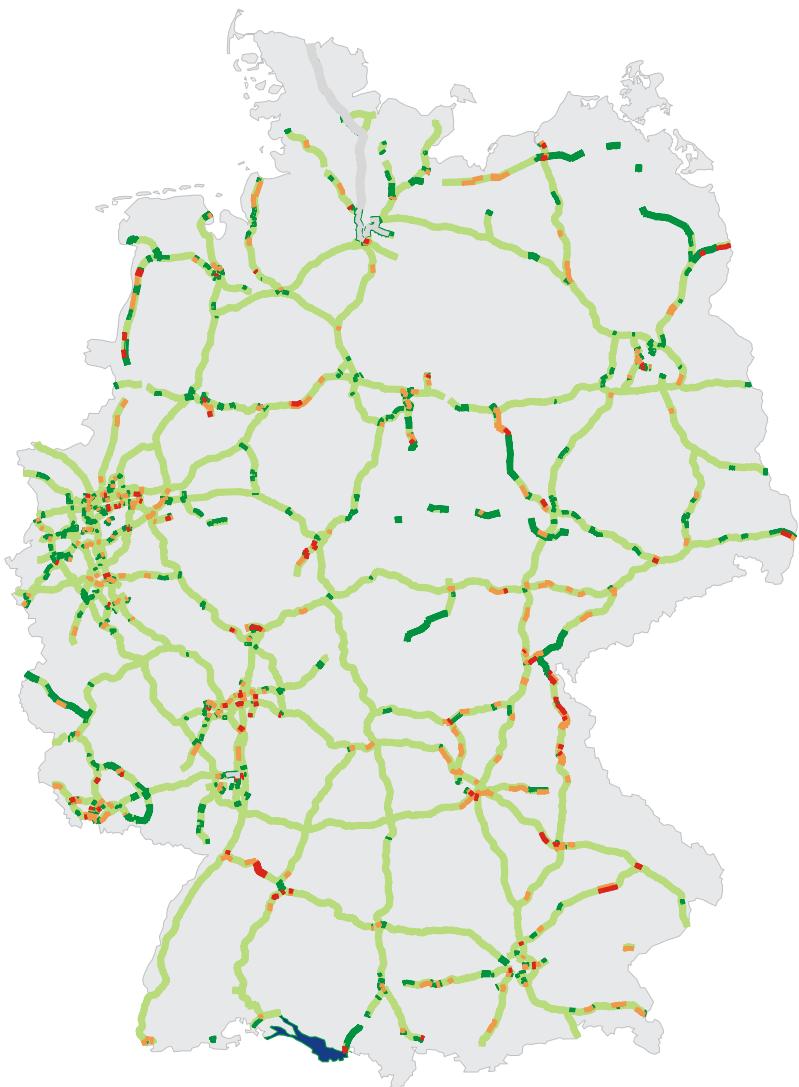

## Methodology Requirements

Road administrations have to determine poor road sections/itineraries where possible improvements will be highly cost-efficient.

Methodology for accident analysis has to

- ⇒ be based on costs (€)
- ⇒ provide a ranking of sections for further analysis

# Accident Rate

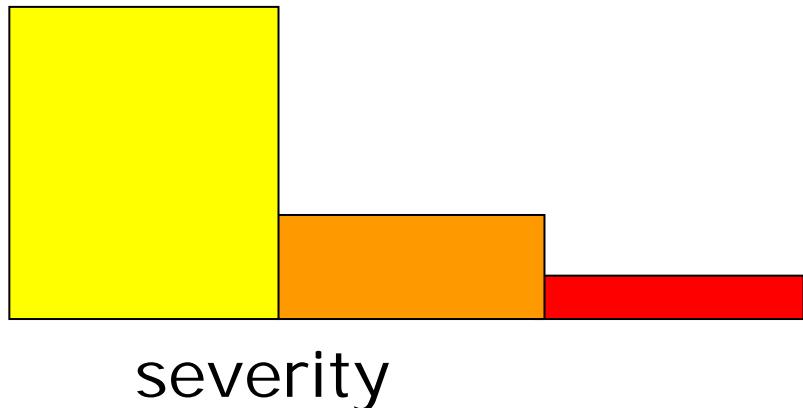

Accident Rate  $\frac{\text{Accidents}}{10^6 \text{ veh} \cdot \text{km}}$

0 - 0,06	(n=1158)
0,06 - 0,25	(n=3661)
0,25 - 0,42	(n=360)
0,42 - 0,72	(n=106)
0,72 and more	(n=37)

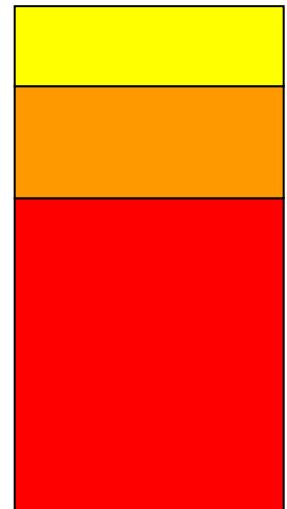

Accidents with personal  
injury on German  
motorways 2002

## Accident Cost instead of Number

number  
of  
accidents

accident  
cost

- joint analysis of accidents of different severity
- consideration of different casualty structures
- basis for cost-benefit analysis

## Safety Potential

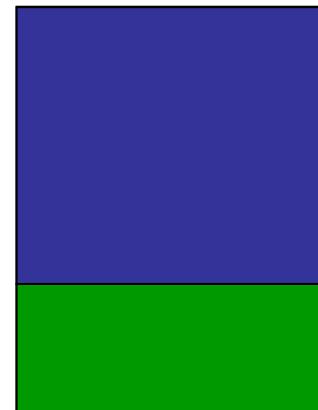

actual accident cost per km

-

target accident cost per km

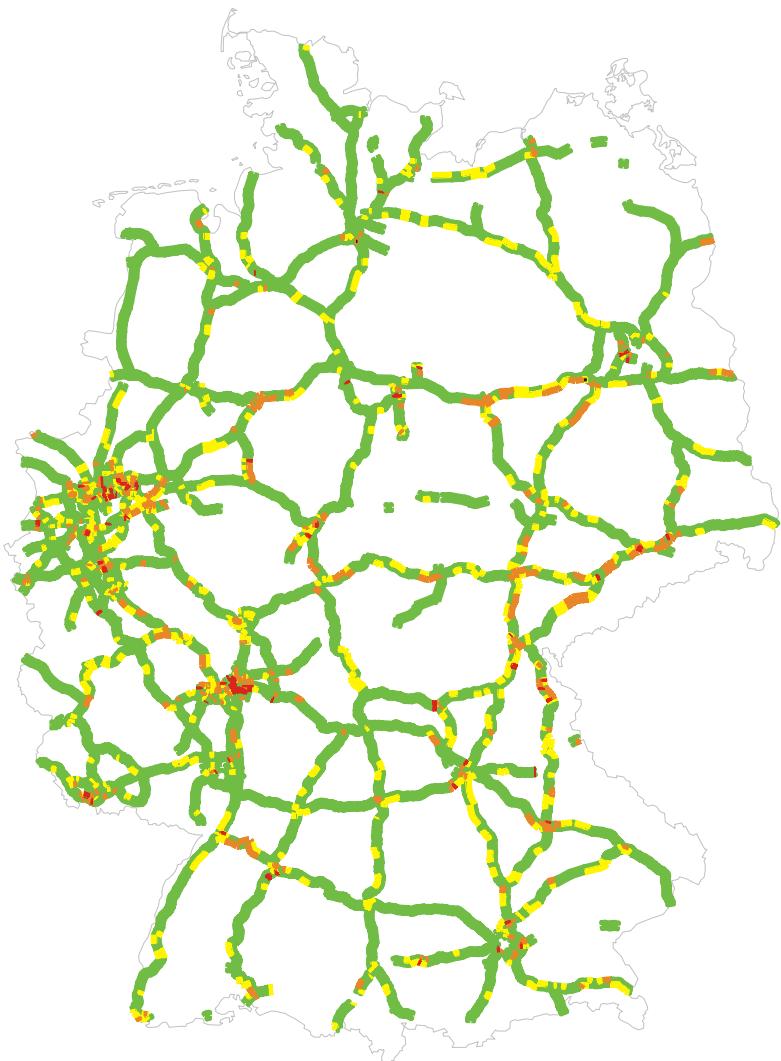

=

**safety potential**

- = accident cost/km that could be saved by improvement measures
- = accident cost to be compared with costs for measures (cost-benefit analysis)

# Safety Potential

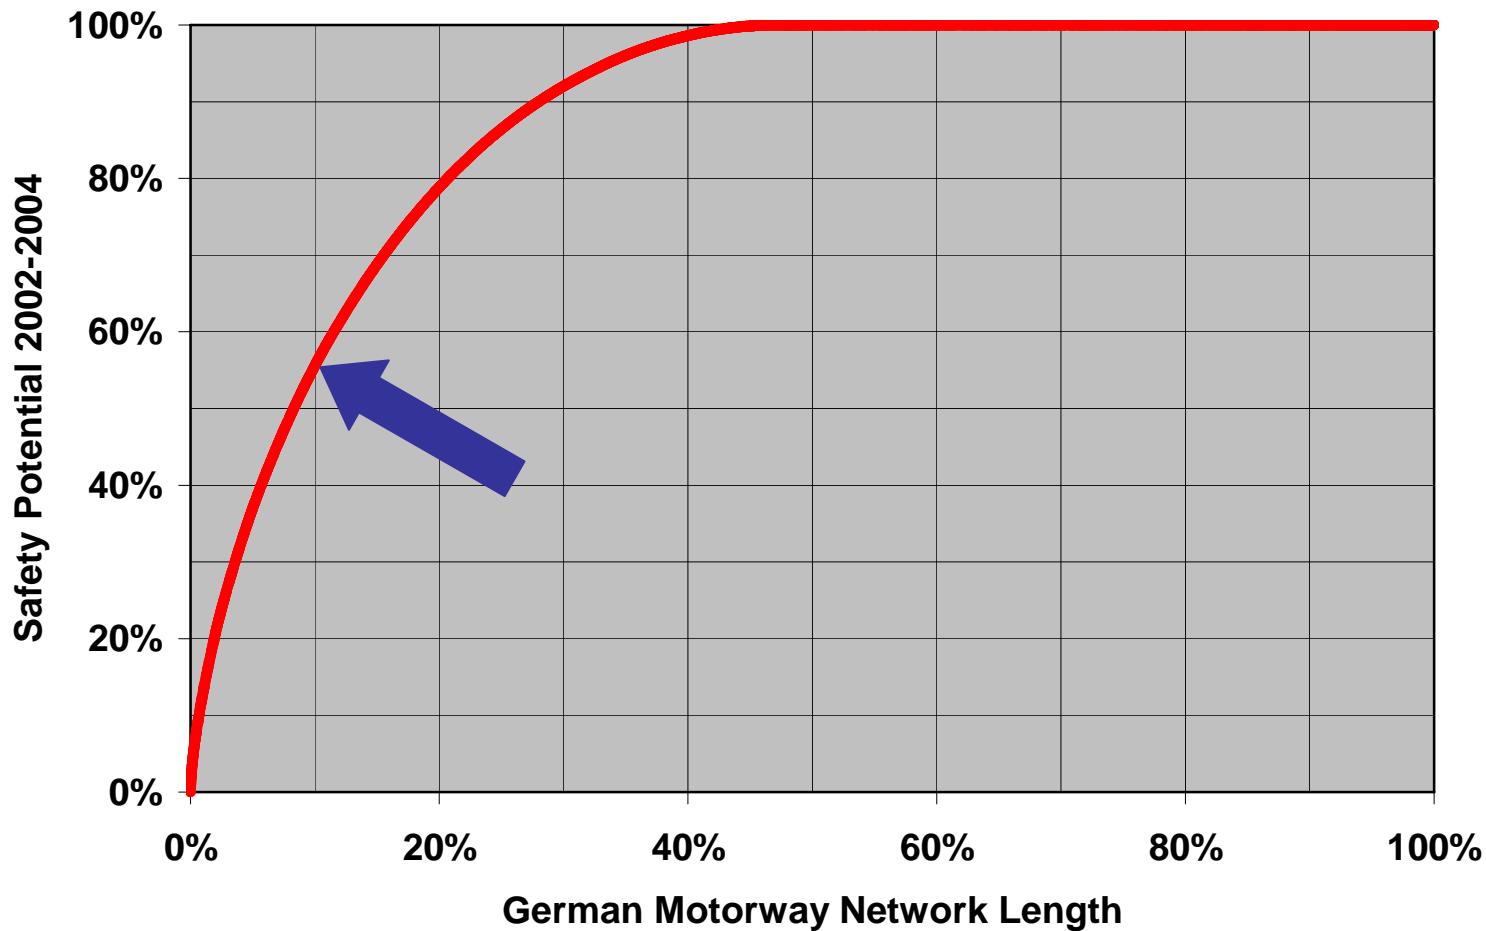

Safety Potential  $\frac{1000 \text{ Euro}}{\text{km}}$

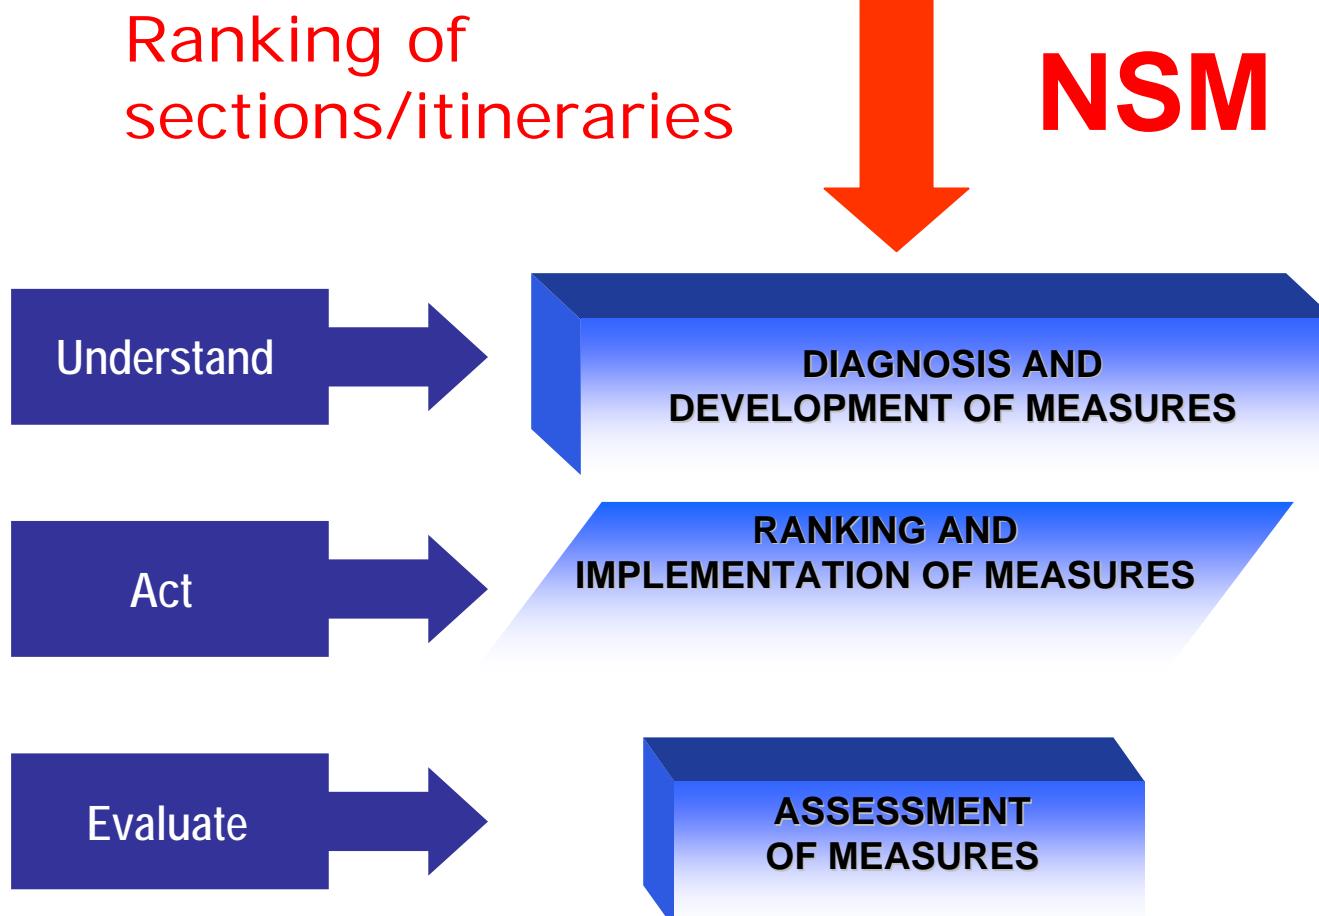

- until 50 (n = 4.124)
- 50 - 105 (n = 562)
- 105 - 250 (n = 316)
- 250 and more (n = 82)

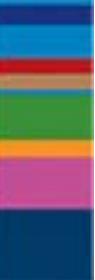

Accidents with personal injury and serious damage-only accidents on German motorways 2002-2004

## Safety Potential / Network length

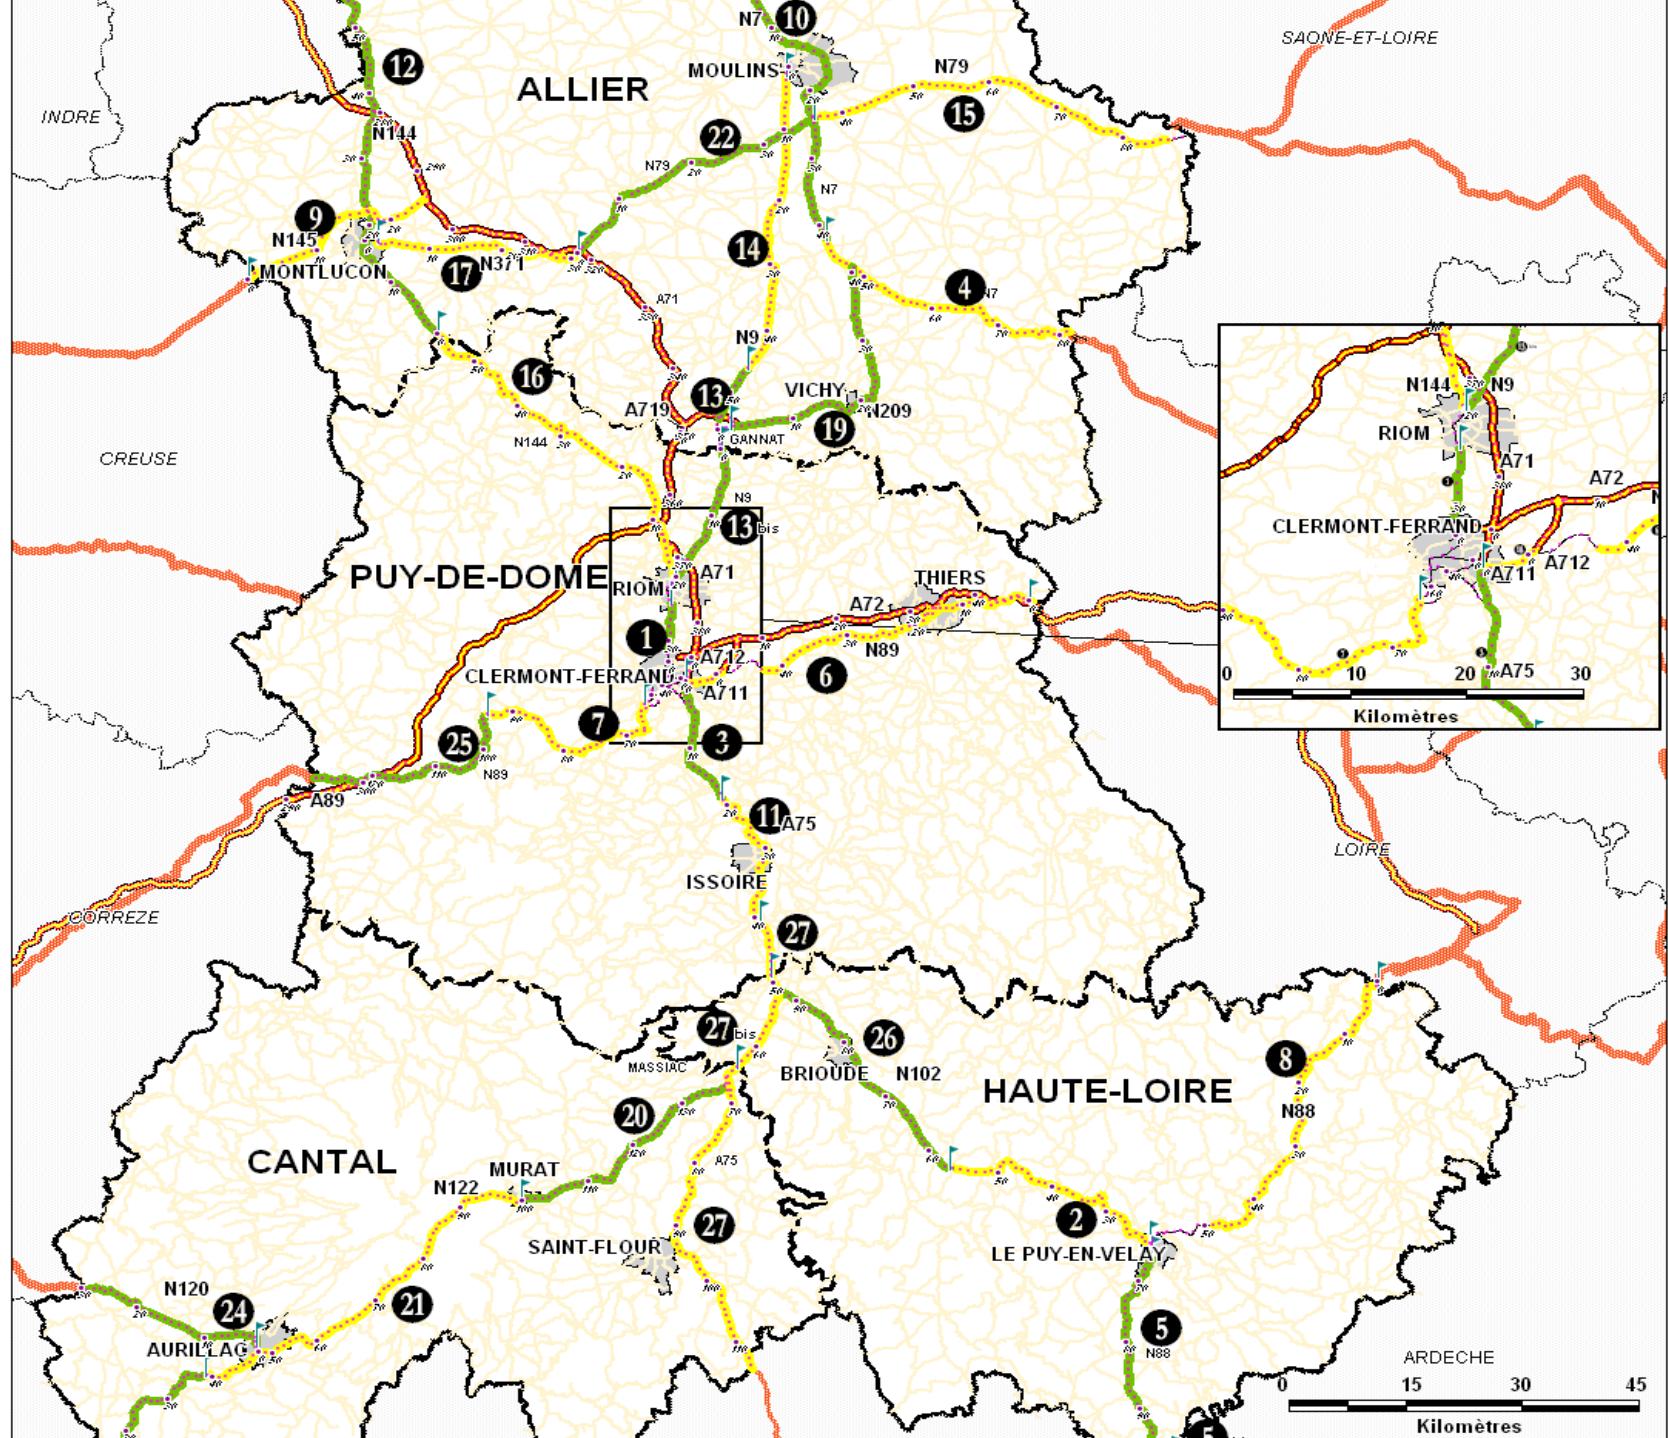

# Improving Safety of Existing Road Networks

# **From Safety Potential to measures - A concrete example**

**1998-2002:**

- ➔ 97 accidents (49 serious)
- ➔ 22 fatalities
- ➔ 50 seriously injured
- ➔ 105 slightly injured

**Safety potential = €450 000**

# Diagnosis

33km, 3 sections with poor & heterogeneous geometric characteristics – series of punctual improvements

Average daily traffic: 8700, 4300, 6800 (vehicle/day) – mostly short distances journeys

	Length	Nb accidents	Density	National density	Rate (/10^9v eh.km)	National rate
1st section	9 km	26	0,55	0,35	17,5	12
2nd section	6 km	18	0,52	0,35	33,5	12
3rd section	18 km	53	0,51	0.35 to 0,43	20.5	9,7 to 12

# Diagnosis and action guidelines

## 3 accident types:

- ➔ In curve
- ➔ On wet driveway
- ➔ In slope

## 7 high risk road sections:

- ➔ 2 junctions
  - Coubladour
  - La Pierre Plantée
- ➔ 3 curves
  - Carrières de La Denise
  - La Chazotte
  - Pouzols
- ➔ 2 zones
  - Plaine de Bleu
  - 1 zone by night

# Diagnosis and action guidelines

<b>4 major accidents scenarios</b>	<b>Accident number (AN)</b>	<b>SI / AN</b>
<b>1 – Loose of control on wet roadway</b>	<b>27</b>	<b>0,74</b>
<b>2 – Junction with a secondary road</b>	<b>14</b>	<b>0,69</b>
<b>3 – Due to a passing/overtaking maneuver</b>	<b>11</b>	<b>0,63</b>
<b>4 – In a curve, on dry roadway</b>	<b>11</b>	<b>1</b>

## Detailed analysis of scenario 1: Accident factors

- ➔ Curve w/ radius < 250 m (14), sometimes < 150m (6)
- ➔ Poor geometry
- ➔ Poor grip
- ➔ Poor legibility (4)
- ➔ cross-town junction too broad (3)
- ➔ No hard shoulder
- ➔ Obstacles: trees (2) pole (1) wall (1)

# Action guidelines for scenario 1

Factors	Nb	Action guidelines
Poor grip in curves w/ radius<250 m	14	<u>Cross town</u> Maintain CTF> 0.5 in curves w/ radius<250 m <u>Outisde build up areas</u> Maintain CTF> 0.5 in Chazotte, des Carrières de la Denise et de Pouzols
Poor geometry		According to each location (local clusters)
Poor legibility, excess right of way	4	Create a visual mask; work on trees alignment and marker posts

## Treatment of a dangerous crossing

- Right turn lane suppression
- Private property access suppression
- Marking reconditioning to actual standards
- Traffic island simplification
- Width reduction

## Where do we stand now?

### **Germany:**

**Safety potential map for motorways (since 2003)**  
**Pilot for all interurban roads in one state (2006)**

### **France:**

**Method applied at national level (2005)**  
**400km thoroughly analysed by end 2006**  
**~600km more in 2007.**  
**16.6 M€ for corrective measures in 2005&2006**

## Conclusion

NSM:

- highlights worst performing sections/itineraries
- provides a priority ranking of sections/ itineraries to be further analysed and improved
- permits a direct comparison: potential savings in accident costs vs. costs of improvement measures => cost effective
- focuses on longer sections/itineraries complements Black Spot Management
- coincides with EU Commission's definition
